Introduction

The purpose of this project is to explore and visualize patterns in NBA player performance using Tableau. By analyzing over 2,500 player-season records spanning 67 NBA seasons from 1950-2017, this project highlights trends in scoring, playing time, and passing efficiency across positions and age groups. The goal is to turn raw player stats into actionable insights that showcase both individual and positional contributions to the game.

Dataset Overview

Source: NBA Player Stats Since 1950 (Kaggle)

https://www.kaggle.com/drgilermo/nba-players-stats/data?select=Seasons_Stats.csv

Scope: 500+ rows, Covers 67 NBA seasons (1950 onward)

Key Fields Used in Analysis:

PTS (Points), MP (Minutes Played), PER (Player Efficiency Rating), AST% (Assist %), TOV% (Turnover %), Pos (Position), Age

Relationship Model

Connected 3 csv files using shared columns.

player_data.csv (Multiple Connections)

NBA Stats Analysis

Average Points by Position

Average Minutes Played by Age

Passing Efficiency by Player (AST% vs TOV%)

Top 5 Scorers

Key Insights

- Players tend to gain more minutes as they age, peaking around 30, then declining afterward.
- Guard-forward players (SG/SF) have the highest scoring averages, while hybrid bigs (F-G, C-F) score the least.
- Elite passers like Stockton and Chris Paul show high assist rates with low turnovers.
- Top career scorers include Kareem, Karl Malone, Wilt Chamberlain, Kobe Bryant, and Michael Jordan.

Conclusion

This project allowed me to explore trends and patterns in NBA performance data using Tableau. By analyzing over 2,500 player-season records, I uncovered insights into how scoring varies by position, how player minutes change with age, and which athletes stand out in passing efficiency and total points. The process strengthened my ability to design clean dashboards, model data relationships, and communicate findings visually. Overall, the project demonstrated my ability to turn raw data into clear, actionable insights using modern data analytics tools.
